1. If the compound section shown below is subjected to a 100 kN-m torque, calculate the
   (i) magnitude of maximum shear stress in the section
   (ii) depth and width (B) of the square section that has the same maximum shear stress when
   subjected to the same torque.

     ![Compound Section Diagram]

     ![Square Section Diagram]

2. Calculate the torsional shear stress at C for the non-uniform circular rod shown below (Neglect stress
   concentration) [Given G=12000 ksi]

     ![Distributed Torque Diagram]

3. Calculate the maximum compound normal stress in the beam shown below (subjected to inclined
   loading) and show the point/points where it occurs [The beam area is a 0.5' x 1' rectangle]
4. The figure below shows a rigid weightless beam ABC loaded as shown, being supported by helical springs A and B. If spring B deflects 1" due to the superimposed load (w k/ft), calculate the values of
(i) superimposed load, (ii) deflection of spring A, (iii) maximum shear stress at spring A
[Given: The stiffness of spring A and spring B are similar. Both springs have coil diameter = 1", average spring diameter = 5", number of coils = 8 and shear modulus = 12000 ksi].

5. The maximum and minimum stresses (\(\sigma_{\text{max}}\) and \(\sigma_{\text{min}}\)) for the element shown below are related by \(\sigma_{\text{max}} = 3\sigma_{\text{min}}\). Calculate the shear stress \((\tau_{xy})\) for this element and draw the Mohr’s circle of stresses.

6. For the beams shown below,
a) Write the expression for loading function \(w(x)\) using singularity functions,
b) Write down the boundary conditions,
c) Comment on whether the beams are statically determinate or indeterminate and
d) Draw the qualitative deflected shapes.

7. Derive the Euler formula of critical load for slender column and state the assumption used for deriving the formula.
8. Calculate the allowable value of $F$ for the truss shown below using the AISC-ASD criteria. [Given: The truss members are hollow circular tubes of 4" outside and 3" inside diameter, $E = 29000$ ksi, $f_y = 50$ ksi for all members].

9. For the beam shown below, use the Singularity Function Method to calculate the force $P$ needed to make the deflection at $B$ equal to zero [Given: $EI = 40 \times 10^3$ k-ft$^2$].

10. Use the conjugate beam method to calculate the deflection at $A$ for the following beam. [$EI_{AB} = 20,000$ k-ft$^2$, $EI_{BC} = 40,000$ k-ft$^2$].

11. Solve Problem 10 using the Moment-Area Theorem.

12. Calculate the value of $P$ if the deflection at mid point is 6 inch downward. [Given: $EI = 40 \times 10^3$ k-ft$^2$].
13. A 20-ft long fixed-ended column has a symmetric cross-sectional area as shown below and is made of a nonlinear material with stress-strain relationship given by $\sigma = \sigma_0 \sin(\varepsilon/\varepsilon_0)$, where $\sigma$ is the stress (ksi) and $\varepsilon$ is the strain. If $\sigma_0 = 4$ ksi and $\varepsilon_0 = 0.003$, calculate the critical load for the column.

![Fixed-ended column](image)

Circular hole of 5"-diameter

Cross-section

14. Refer to the following figure calculate the buckling load of column AB if the frame is (i) braced, (ii) unbraced [Given: $EI = 40,000$ k-ft²].

![Frame](image)

- **Biaxial Bending Stress**: \( \sigma_x(z, y) = M_x y/L_x + M_y z/L_y \)
- **Combined Axial Stress and Biaxial Bending Stress**: \( \sigma_z(x, y) = -P/A - M_y y/L_y - M_x x/L_x \)
- **Corner point of the kerna of a Rectangular Area**: \( (b/6, 0), (0, b/6), (-b/6, 0), (0, -b/6) \)
- **Maximum shear stress on a Helical spring**: \( \tau_{max} = \tau_{direct} + \tau_{min} = P/A + T/r = P/A (1 + 2R/r) \)
- **Stiffness of a Helical spring**: \( k = Gd^4/(64R^2 N) \)

\[
\begin{align*}
\sigma_{x,y} &= \frac{(\sigma_x + \sigma_y)/2 + \left\{ (\sigma_x - \sigma_y)/2 \right\} \cos \theta + (\tau_{x,y}) \sin \theta \cos \frac{\theta}{2} + \left\{ (\sigma_x - \sigma_y)/2 \right\} \cos \frac{\theta}{2}}{\left\{ (\sigma_x - \sigma_y)/2 \right\} \cos \frac{\theta}{2} + (\tau_{x,y}) \sin \theta} \cos (20 - \alpha) \\
\tau_{x,y} &= -\left\{ (\sigma_x - \sigma_y)/2 \right\} \sin \theta \cos \frac{\theta}{2} - \left\{ (\sigma_x - \sigma_y)/2 \right\} \cos \frac{\theta}{2} \cos \theta - \left\{ (\sigma_x - \sigma_y)/2 \right\} \sin \theta \sin \frac{\theta}{2} - \left\{ (\sigma_x - \sigma_y)/2 \right\} \cos \frac{\theta}{2} \sin \theta \\
\text{where: } \tan \alpha &= 2 \frac{\tau_{x,y}}{(\sigma_x - \sigma_y)} \\
\sigma_{x,y}(max) &= \frac{(\sigma_x + \sigma_y)/2 + \left\{ (\sigma_x - \sigma_y)/2 \right\} \cos \theta + (\tau_{x,y}) \sin \theta}{\left\{ (\sigma_x - \sigma_y)/2 \right\} \cos \theta + (\tau_{x,y}) \sin \theta} \cos \frac{\theta}{2} + (\tau_{x,y}) \sin \theta \sin \frac{\theta}{2} + \left\{ (\sigma_x - \sigma_y)/2 \right\} \cos \frac{\theta}{2} \cos \theta \\
\sigma_{x,y}(min) &= \frac{(\sigma_x + \sigma_y)/2 - \left\{ (\sigma_x - \sigma_y)/2 \right\} \cos \theta + (\tau_{x,y}) \sin \theta}{\left\{ (\sigma_x - \sigma_y)/2 \right\} \cos \theta + (\tau_{x,y}) \sin \theta} \cos \frac{\theta}{2} + (\tau_{x,y}) \sin \theta \sin \frac{\theta}{2} + \left\{ (\sigma_x - \sigma_y)/2 \right\} \cos \frac{\theta}{2} \cos \theta \\
\tau_{x,y}(max) &= \left\{ (\sigma_x - \sigma_y)/2 \right\} \cos \frac{\theta}{2} + (\tau_{x,y}) \sin \theta \sin \frac{\theta}{2} + \left\{ (\sigma_x - \sigma_y)/2 \right\} \cos \frac{\theta}{2} \cos \theta \\
\tau_{x,y}(min) &= -\left\{ (\sigma_x - \sigma_y)/2 \right\} \sin \theta \cos \frac{\theta}{2} - \left\{ (\sigma_x - \sigma_y)/2 \right\} \cos \frac{\theta}{2} \cos \theta - \left\{ (\sigma_x - \sigma_y)/2 \right\} \sin \theta \sin \frac{\theta}{2} - \left\{ (\sigma_x - \sigma_y)/2 \right\} \cos \frac{\theta}{2} \sin \theta \\
\text{Mohr’s Circle: Center (a, 0) } = (\sigma_{x,y}/2, 0) \text{ and radius } R = \left\{ (\sigma_{x,y}/2)^2 + (\tau_{x,y})^2 \right\}
\end{align*}

- **For Yielding to take place**
  - Maximum Normal Stress Theory (Rankine): \( \sigma_1 \geq Y \text{ or } \sigma_2 \geq Y \)
  - Maximum Normal Strain Theory (St. Venant): \( \varepsilon_1 - \varepsilon_2 \geq \gamma \text{ or } \varepsilon_2 - \varepsilon_1 \geq Y \)
  - Maximum Shear Stress Theory (Tresca): \( \left| \sigma_1 - \sigma_2 \right| \geq Y \text{ or } \left| \sigma_2 - \sigma_3 \right| \geq Y \text{ or } \left| \sigma_3 - \sigma_1 \right| \geq Y \)
  - Maximum Distortion-Energy Theory (Von Mises): \( \sigma_1^2 + \sigma_2^2 + \sigma_3^2 - 2\sigma_1\sigma_2 - 2\sigma_2\sigma_3 - 2\sigma_3\sigma_1 \geq Y^2 \)

- **M(x) = EI x = EI d^2y/dx^2**
- **w(x) = EI d^3y/dx^3**
- **w(x) = EI d^3y/dx^3**
- **K(x) = EI x = EI d^2y/dx^2**
- **V(x) = Jw(x) dx = EI d^3y/dx^3**
- **M(x) = \int V(x) dx = EI d^2y/dx^2**
- **S(x) = \int M(x) dx = EI dy/dx = EI \theta(x)**
- **D(x) = \int S(x) dx = EI \varphi(x)**

- **First Moment-Area Theorem**: \( \theta_B - \theta_A = \int (M/EI) dx \)
- **Second Moment-Area Theorem**: \( (x_B - x_A) \theta_B - \varphi_B + \varphi_A = \int x (M/EI) dx \)
